# Reconfigurable Arduino Shield for Biosignal Acquisition

Leozitor Floro de Souza - Douglas College  
Fabio Iaione  
Shih Ting Ju

Federal University of Mato Grosso do Sul - UFMS  
Faculty of Computing - FACOM

---

# Introduction

---

- Specific Analog biosignal acquisition devices
  - ECG
  - EEG
  - PCG
  - EMG

# Introduction: FPAA

- Field Programmable Analog Array
- Integrated Circuit Device.
- Offers Field Programmability.
- Creates reconfigurable analog circuits.
- 2x2 Matrix of Configurable Analog Blocks.

# Introduction: Arduino

- Open source microcontroller board.
- Based on microchip ATmega 328P.
- Equipped with digital/analog I/Os, PWMs, SPI, I2C.
- Programmable via Arduino IDE.

---

# Introduction - Motivation

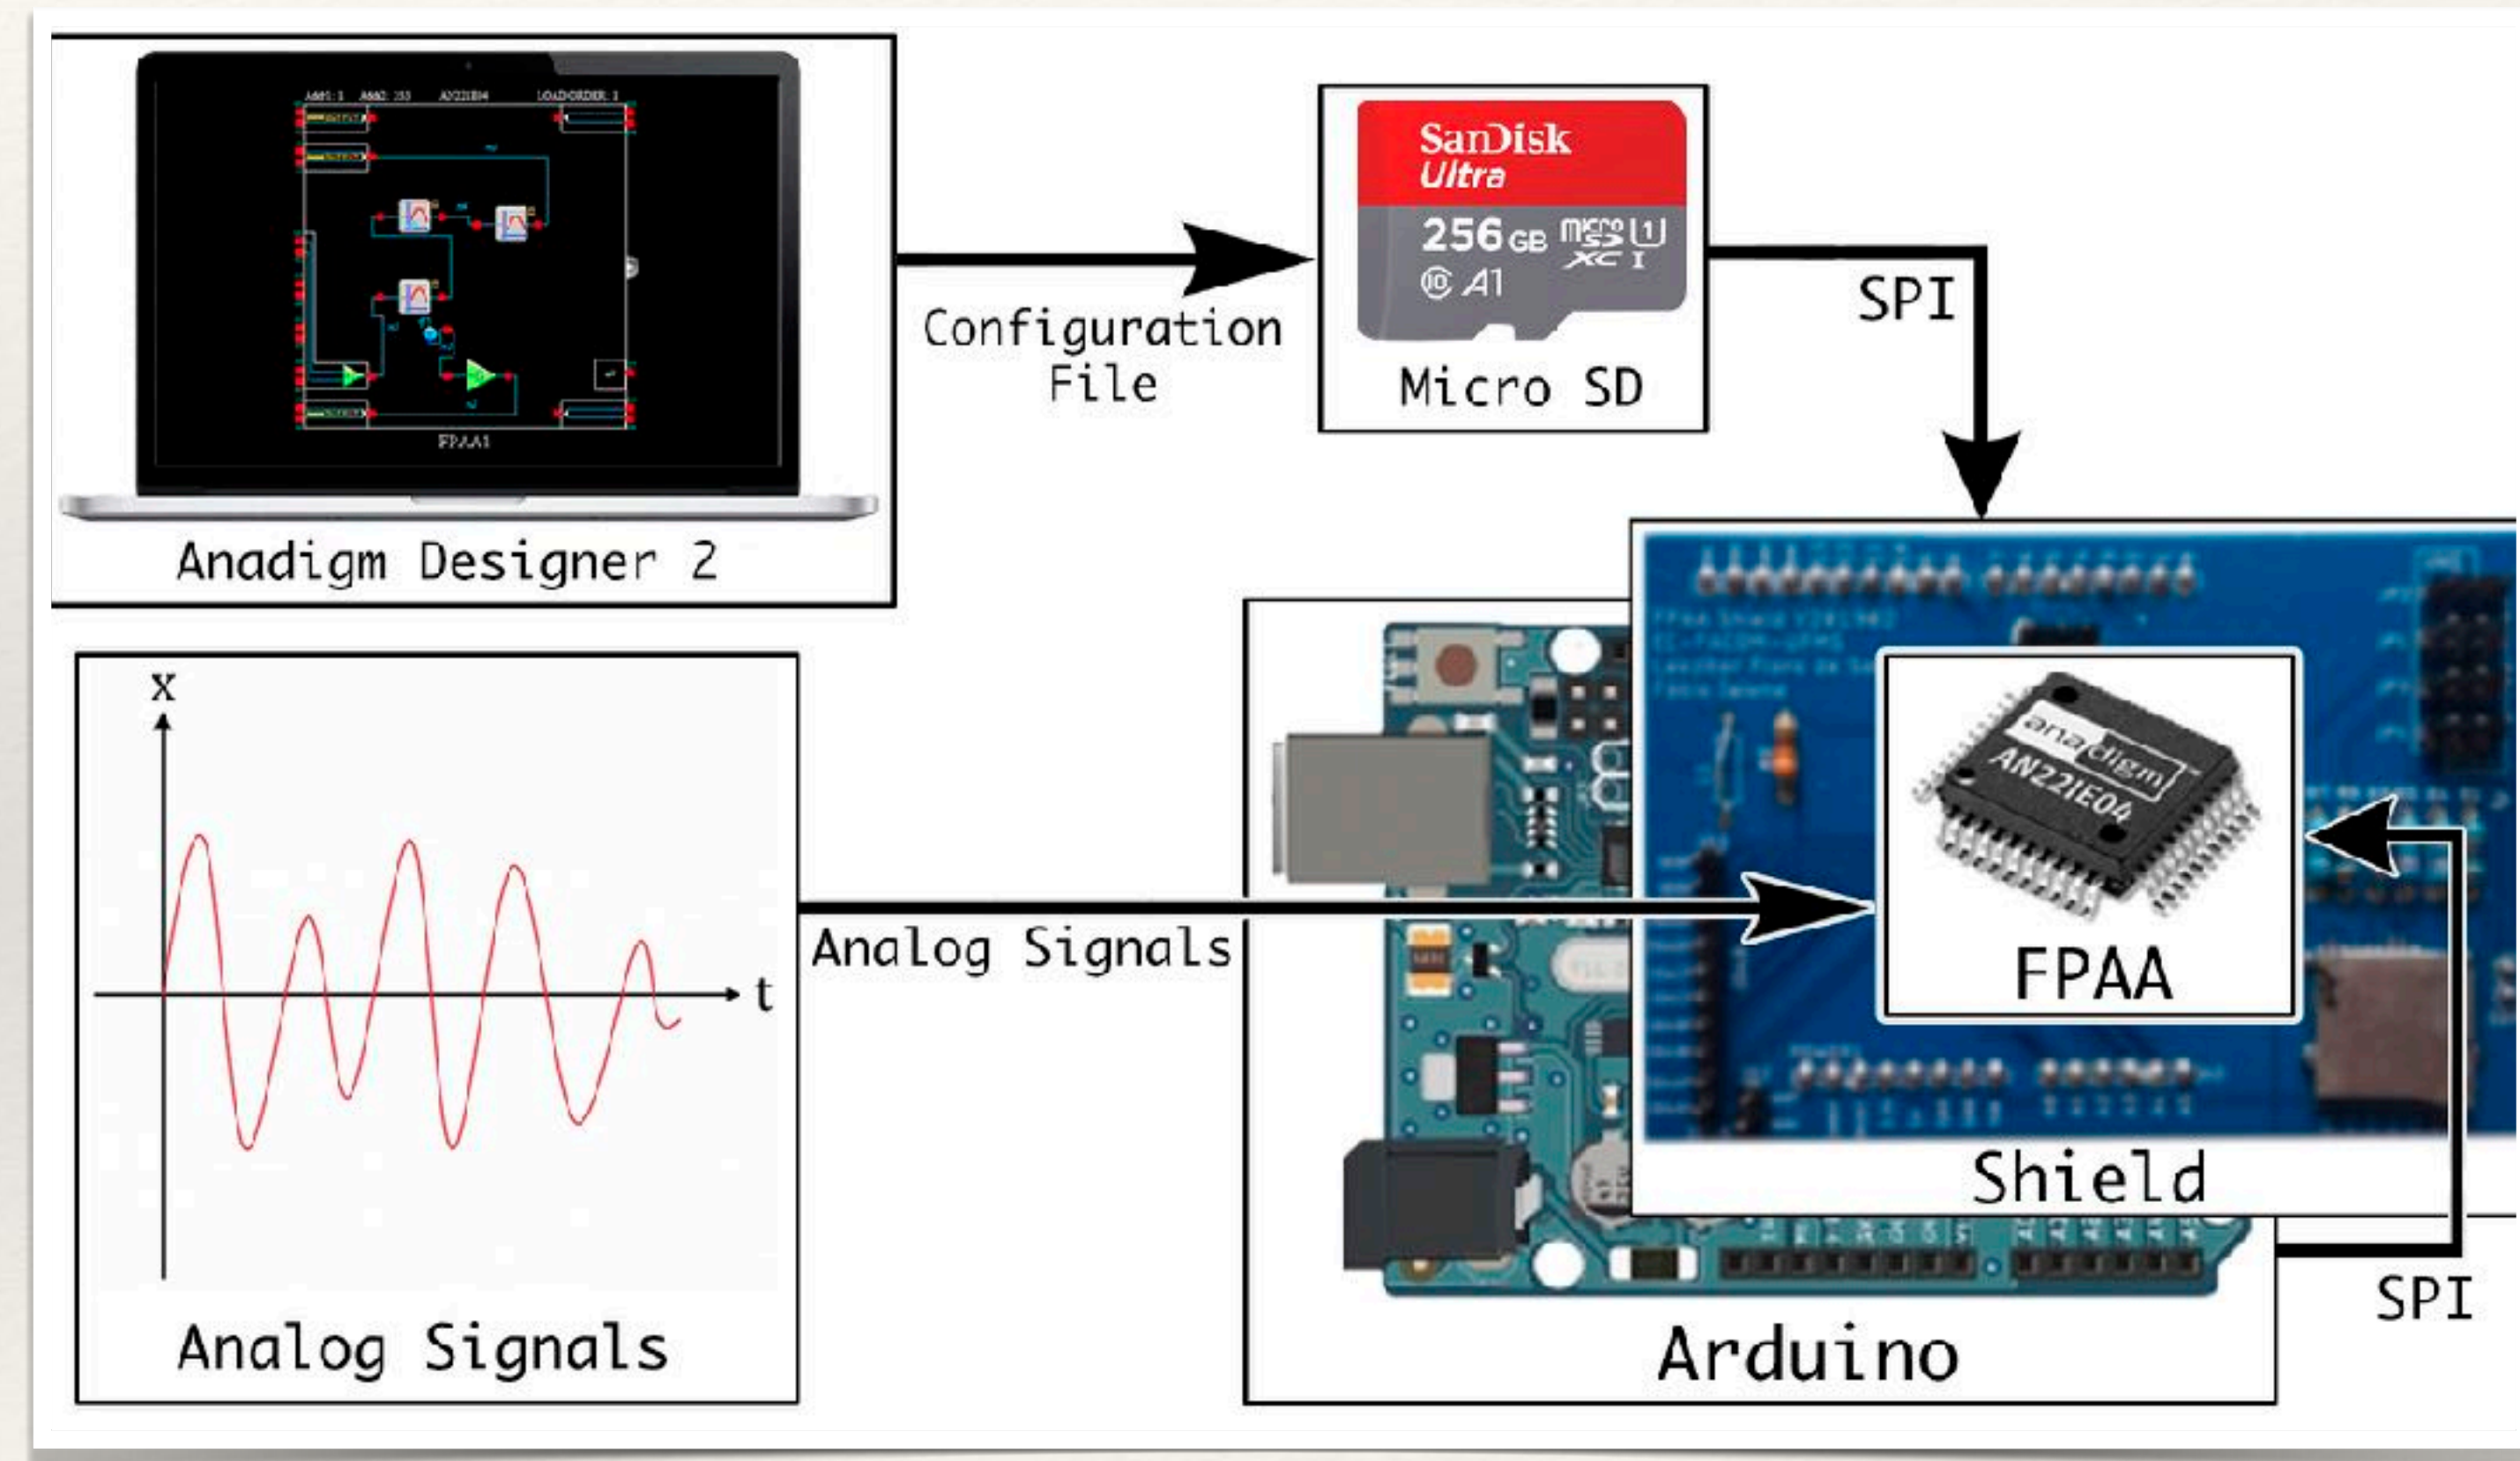

---

- Why not FPPA and Arduino.
- A search to following keywords was done:
  - Arduino
  - Biosigna
  - Bioelectrical
  - ECG or Electrocardiogram
  - EEG or Electroencephalogram
  - EMG or Electromyogram
  - EOG or Electrooculogram
  - ERG or Electroretinogram
  - EGG or Electrogastrogram
- Considering we did not find any similar scientific study, this work aims to create an electronic circuit ( Arduino shield ) and a software library to use and FPPA embedded in a Arduino Board

# Materials and Methods: How the System Works

- ▶ Analog circuit built on Anadigm Designer 2.
- ▶ Configuration transferred to micro SD.
- ▶ Arduino Initializes FPAA, read configuration and sends to FPAA.
- ▶ The analog input passes through FPAA internal analog circuits and is read by Arduino ( analog inputs).

# Materials and Methods: How the System Works

- FPAA requires two clock signals:
  - DCLK for digital communication.
  - ACLK for analog circuits. (switched capacitor filters).
  - Arduino generated the DCLK by software (SPI bit-banging).
- Due to FPPA ACLK internal clock dividers limitation.
  - It is necessary configurable ACLK signal.
  - Is is necessary to generate the ACLK through Arduino as well.

---

# Materials and Methods: Arduino Library

---

- Arduino built in **tone(pin, frequency)** function generated a maximum frequency of 65 kHz.
- A function **setClock(frequency)** was developed, manipulating registration of ATmega time allowing clock generation from 1.95 kHz up to 8 MHz

---

# Materials and Methods: Arduino Library

---

- **FPPAA.begin(“.ahf file”)**
  - Initializes SPI Bus, SD card and FPAA.
- **FPAA.setClock (freq)**
  - Sets the frequency of the FPAA ACKL generated by Arduino allowing values of: F8M (8 MHz), F4M, F2 666M, F2M, F1 6M, F1 333M, F1M, F500K (500 kHz), F250K, F125K, F62 5K, F31 250K, F15 625K, F7 8125K, F3 90625K and F1 953125K;
- **FPAA.update (“.ahf file”)**
  - Sends reconfiguration data to the FPAA without the need for restart (on-the-fly).
- **FPAA.read (pinA, pinB, VREF)**
  - Returns the difference between voltages applied to pins A and B, considering the reference voltage of the Arduino ADC in Volts (VREF). This function returns the difference of the voltages because the FPAA has differential outputs.

# Materials and Methods: PCB Design

- PCB Designed on Auto Desk Eagle, following good practices of PCB design and recommendations of the FPAA manufacturer.

# Results: Arduino Shield

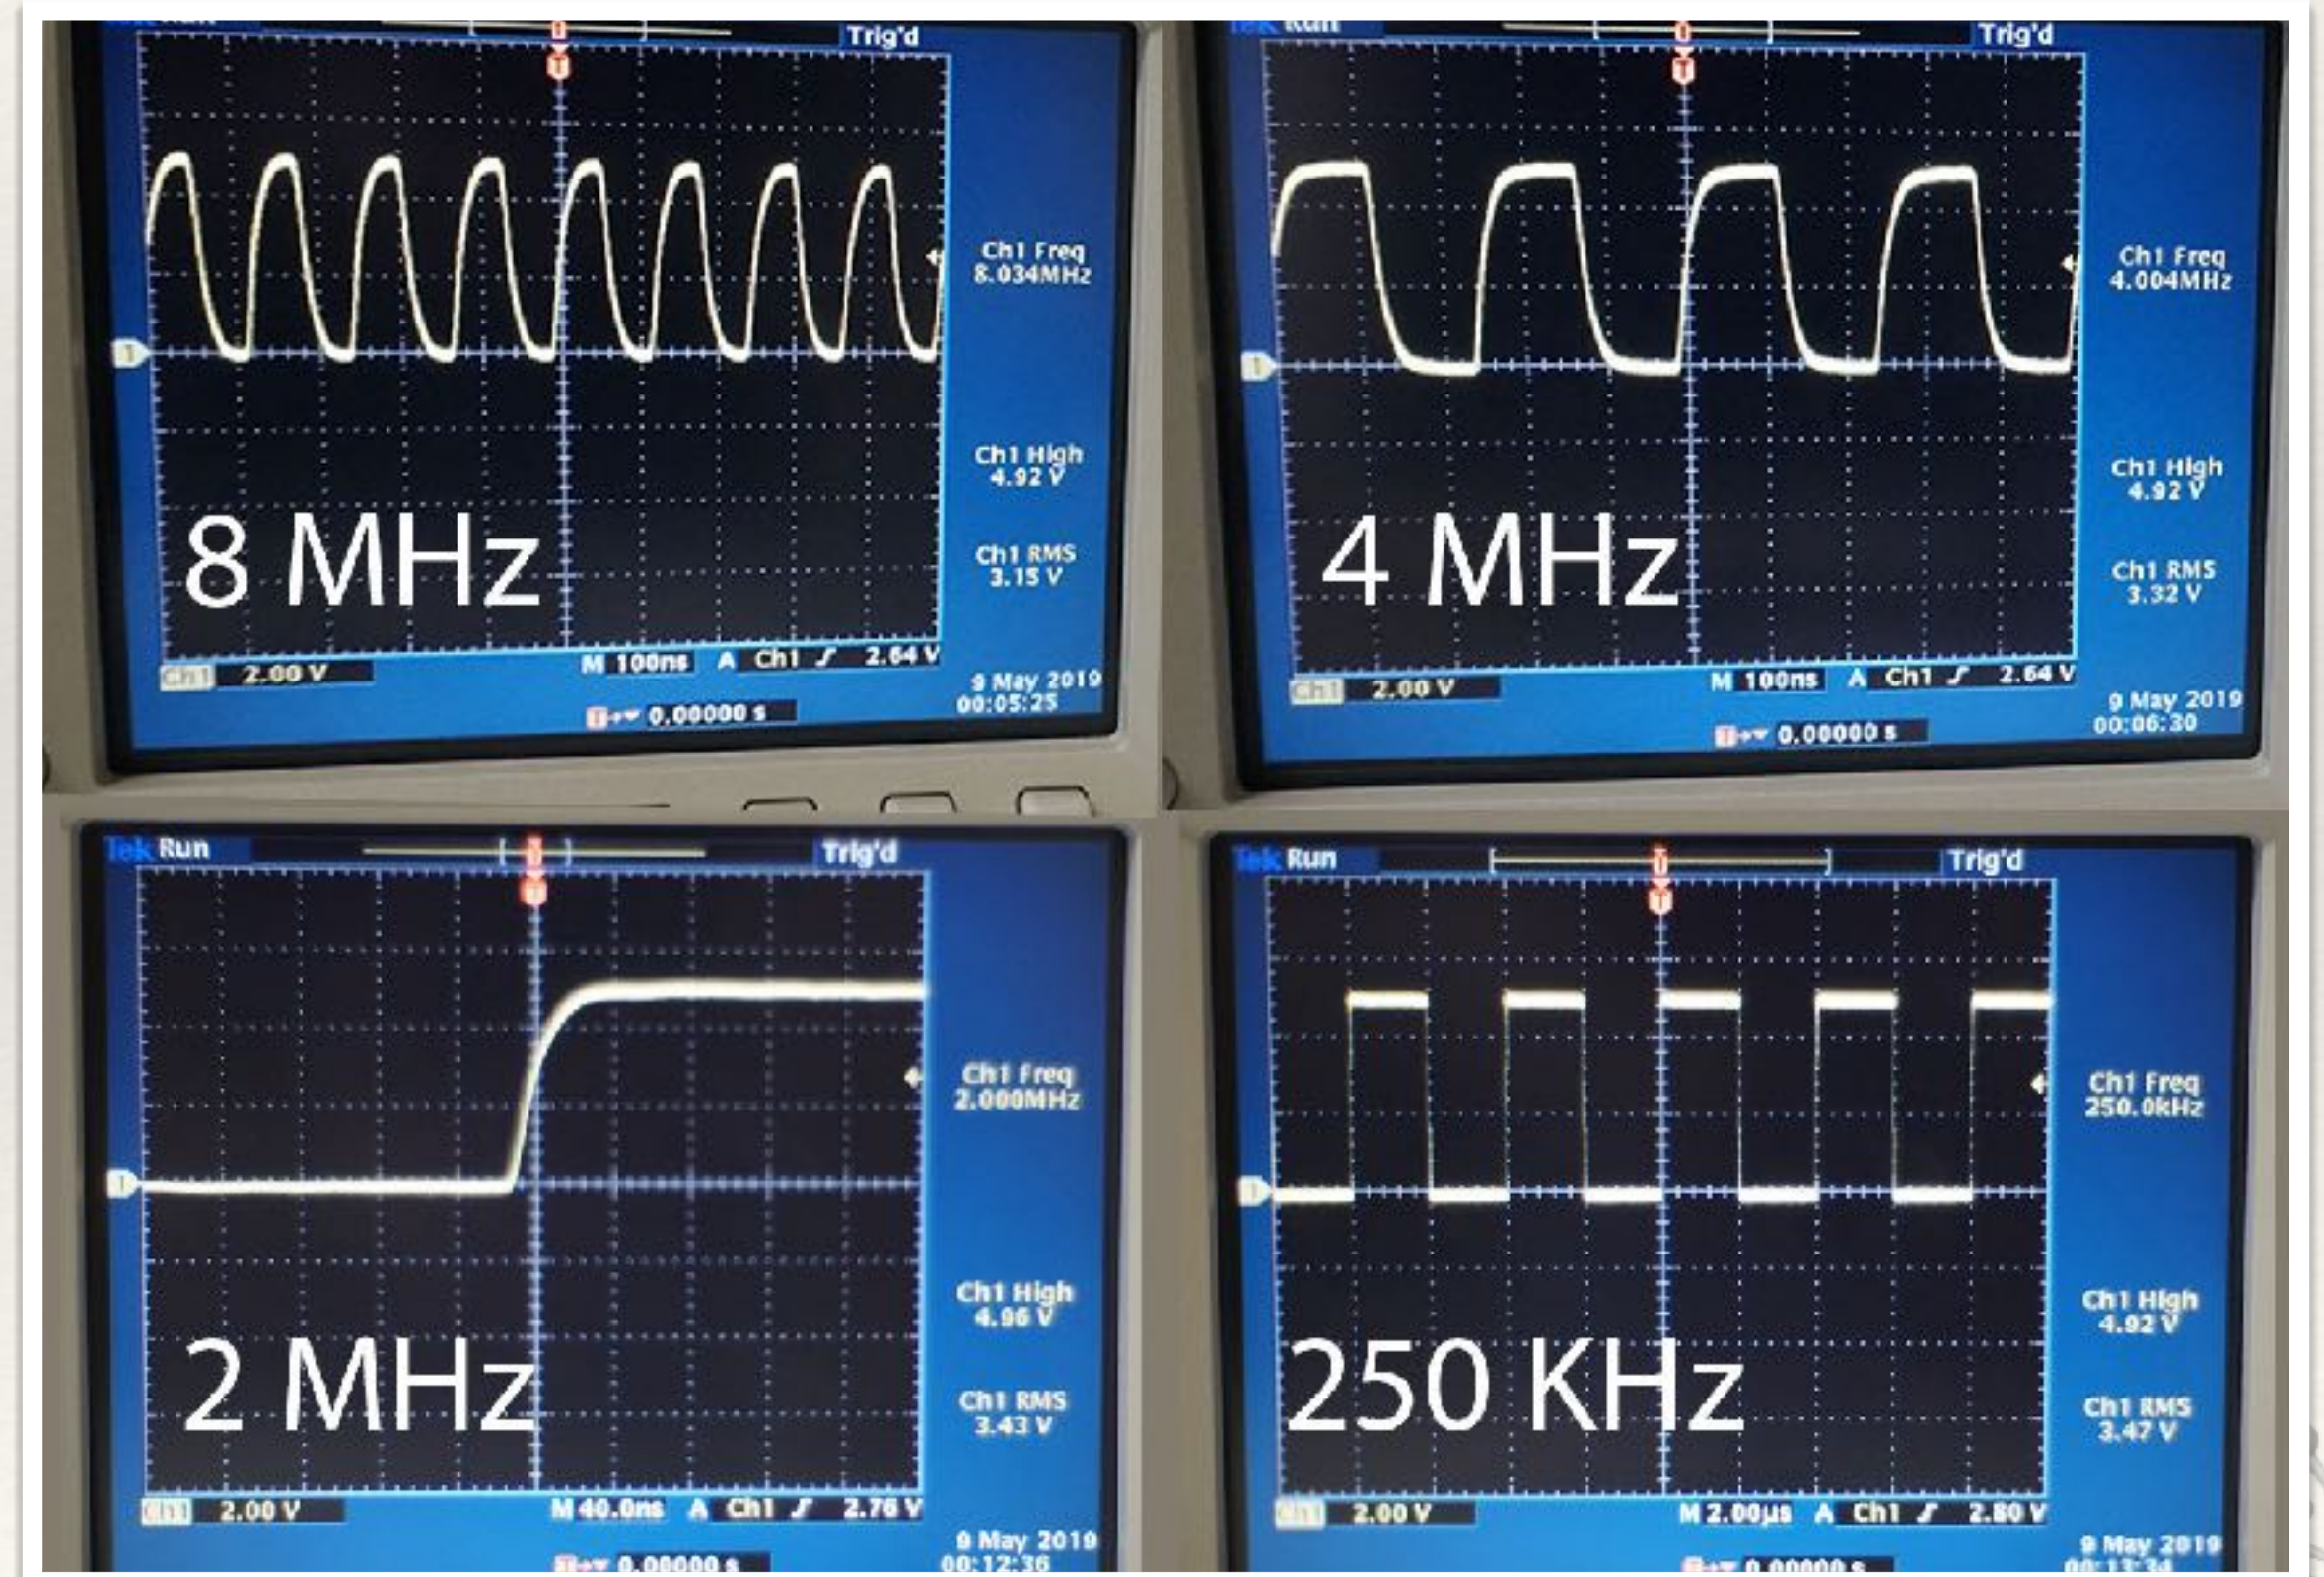

- ▶ Arduino Shield ready and attached to an Arduino Uno Board.

# Results: Clock Test

- Digital Oscilloscope used to assure the correctness of Arduino Clock Generation, that is necessary for FPAA (ACLK).

# Results: Clock Test

- Comparison between theoretical clock and real clock measure.
- Three measurements ( M1, M2 and M3).
- Average Maximum Percentage Error of -0.45 %
- Standard deviation of 0.16%

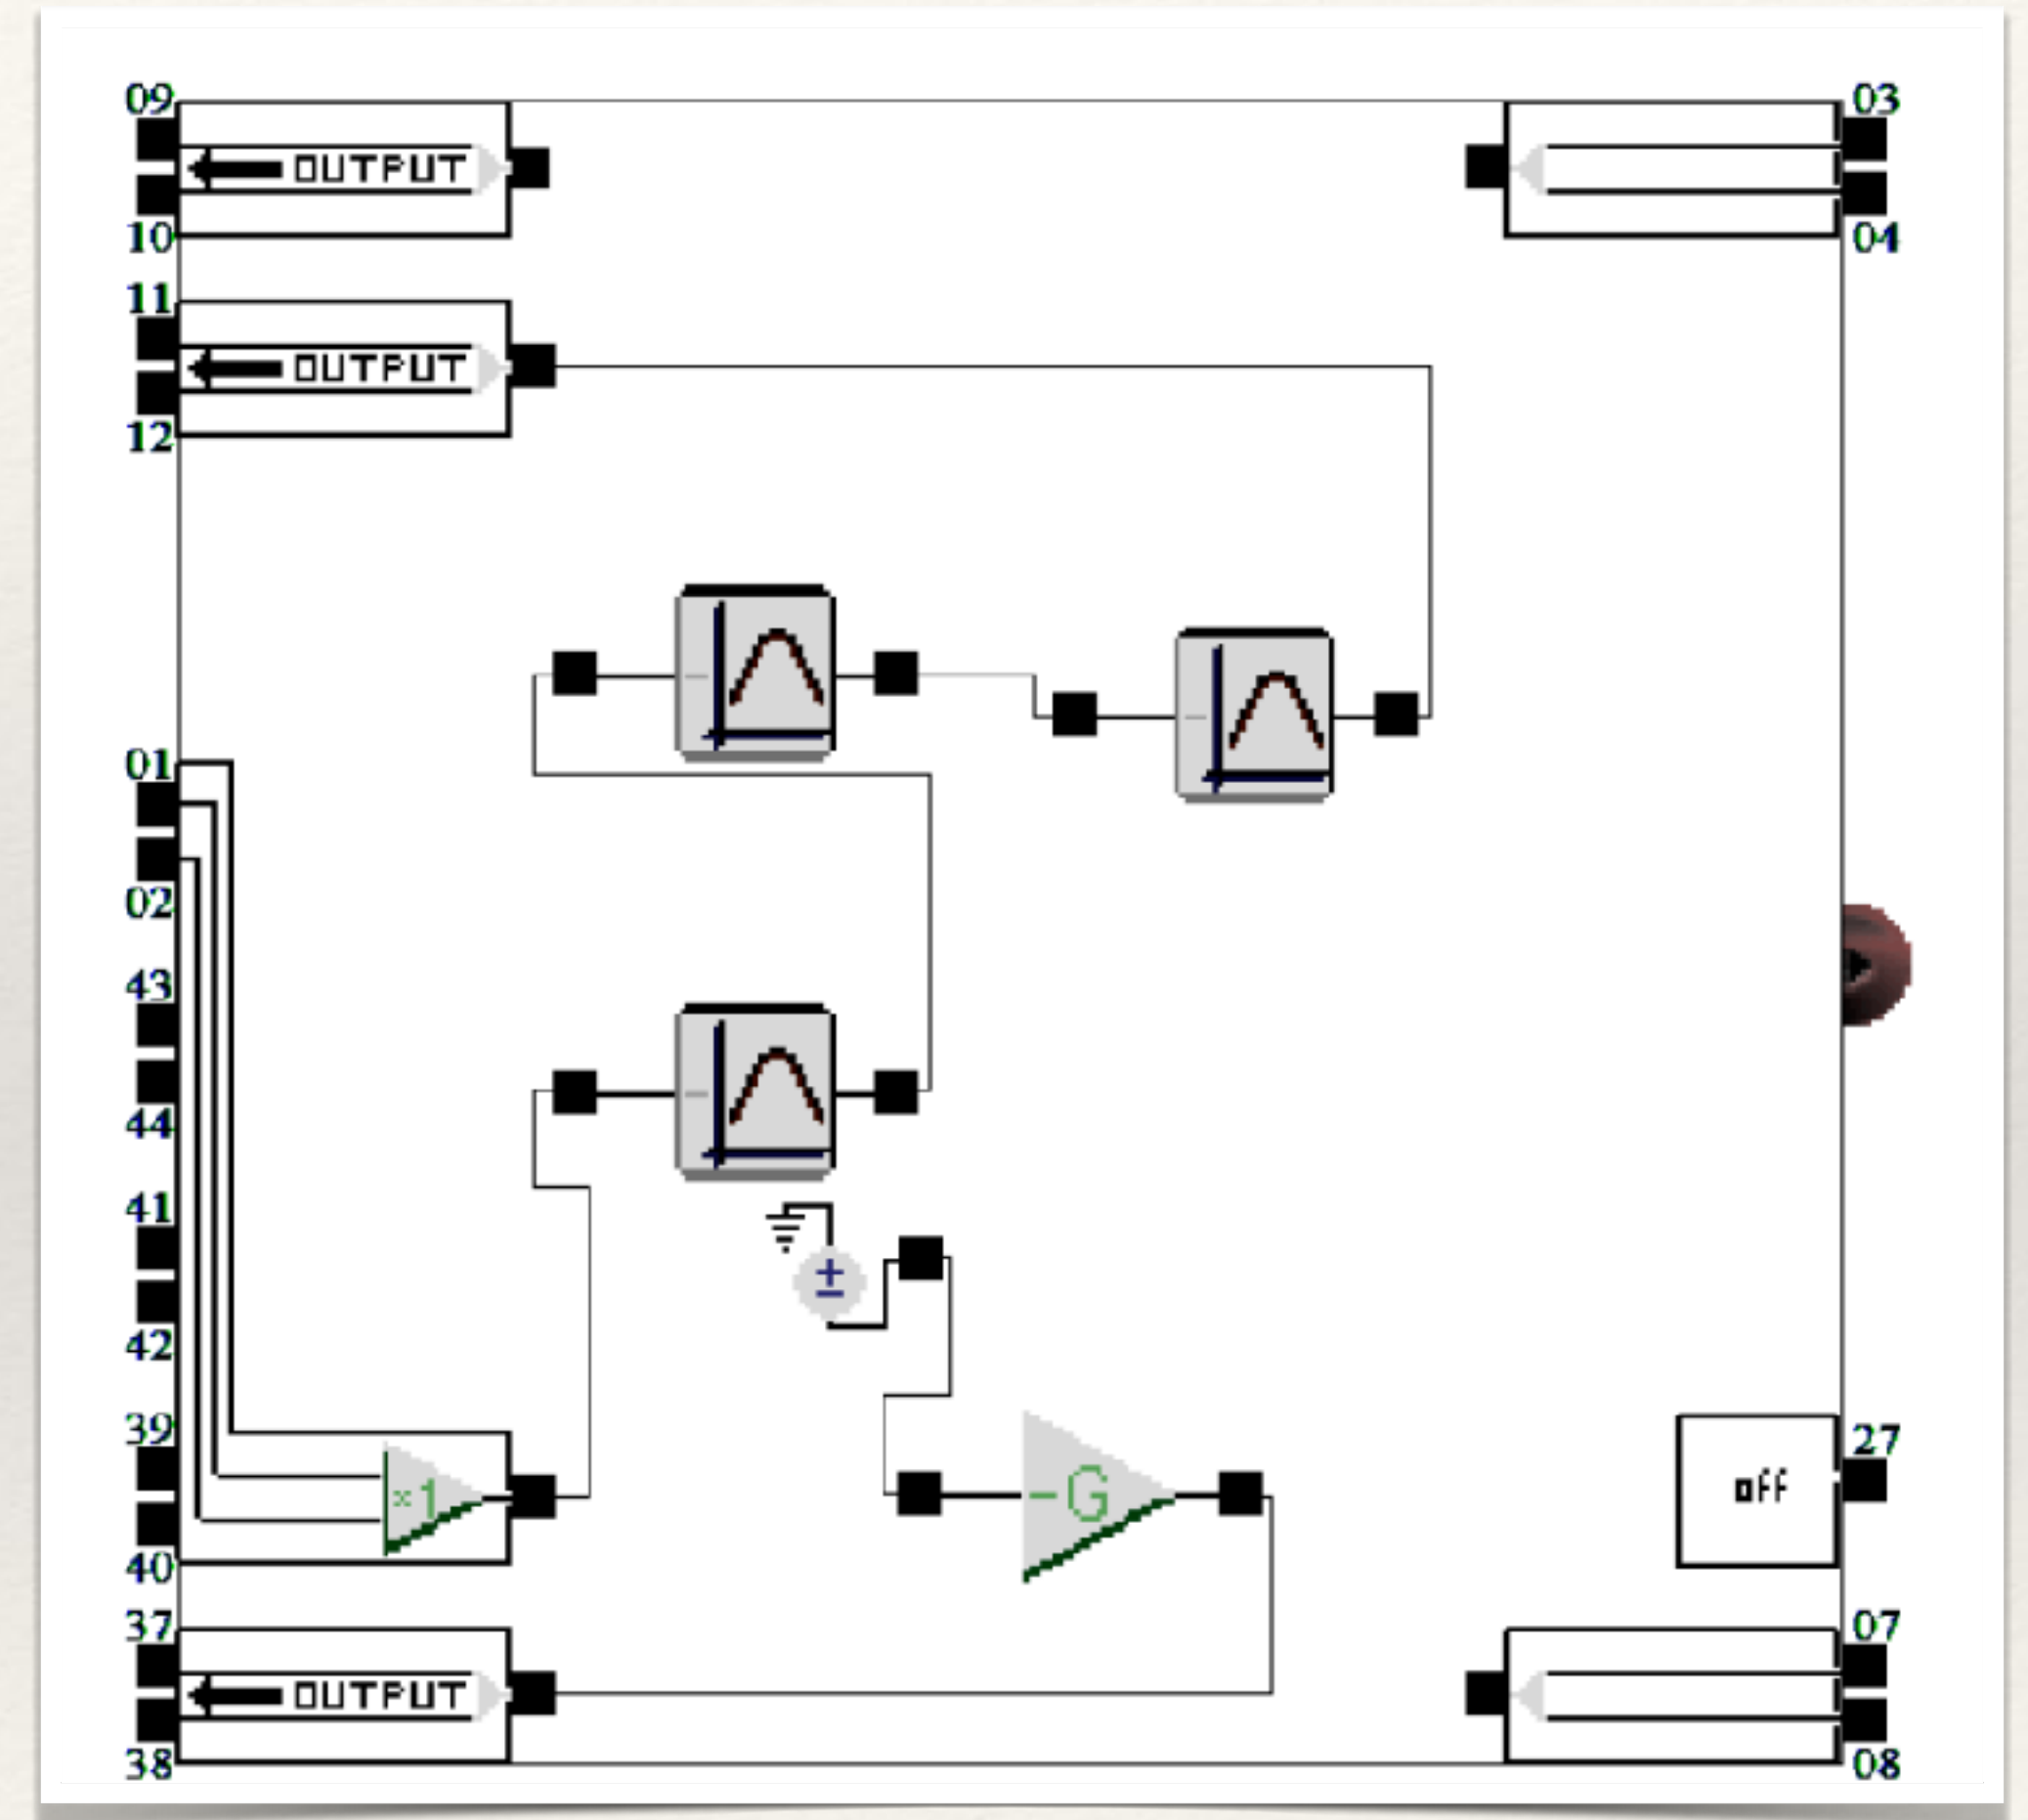

F(Hz)	M1(Hz)	M2(Hz)	M3(Hz)	ME(Hz)	ME(%)

# Results: Filter Implementation

- Arbitrary band-pass filter implemented AnadigmFilter tool available in the AnadigmDesigner2.
- Input Characteristics:
  - Passband ripple: 3 dB
  - Passband gain: 0 dB
  - Stop band attenuation: -30 dB
  - Center frequency: 100 Hz
  - Stop bandwidth: 500Hz

Block diagram of the circuit generated to implement the desired band-pass filter.

# Results: Filter Implementation

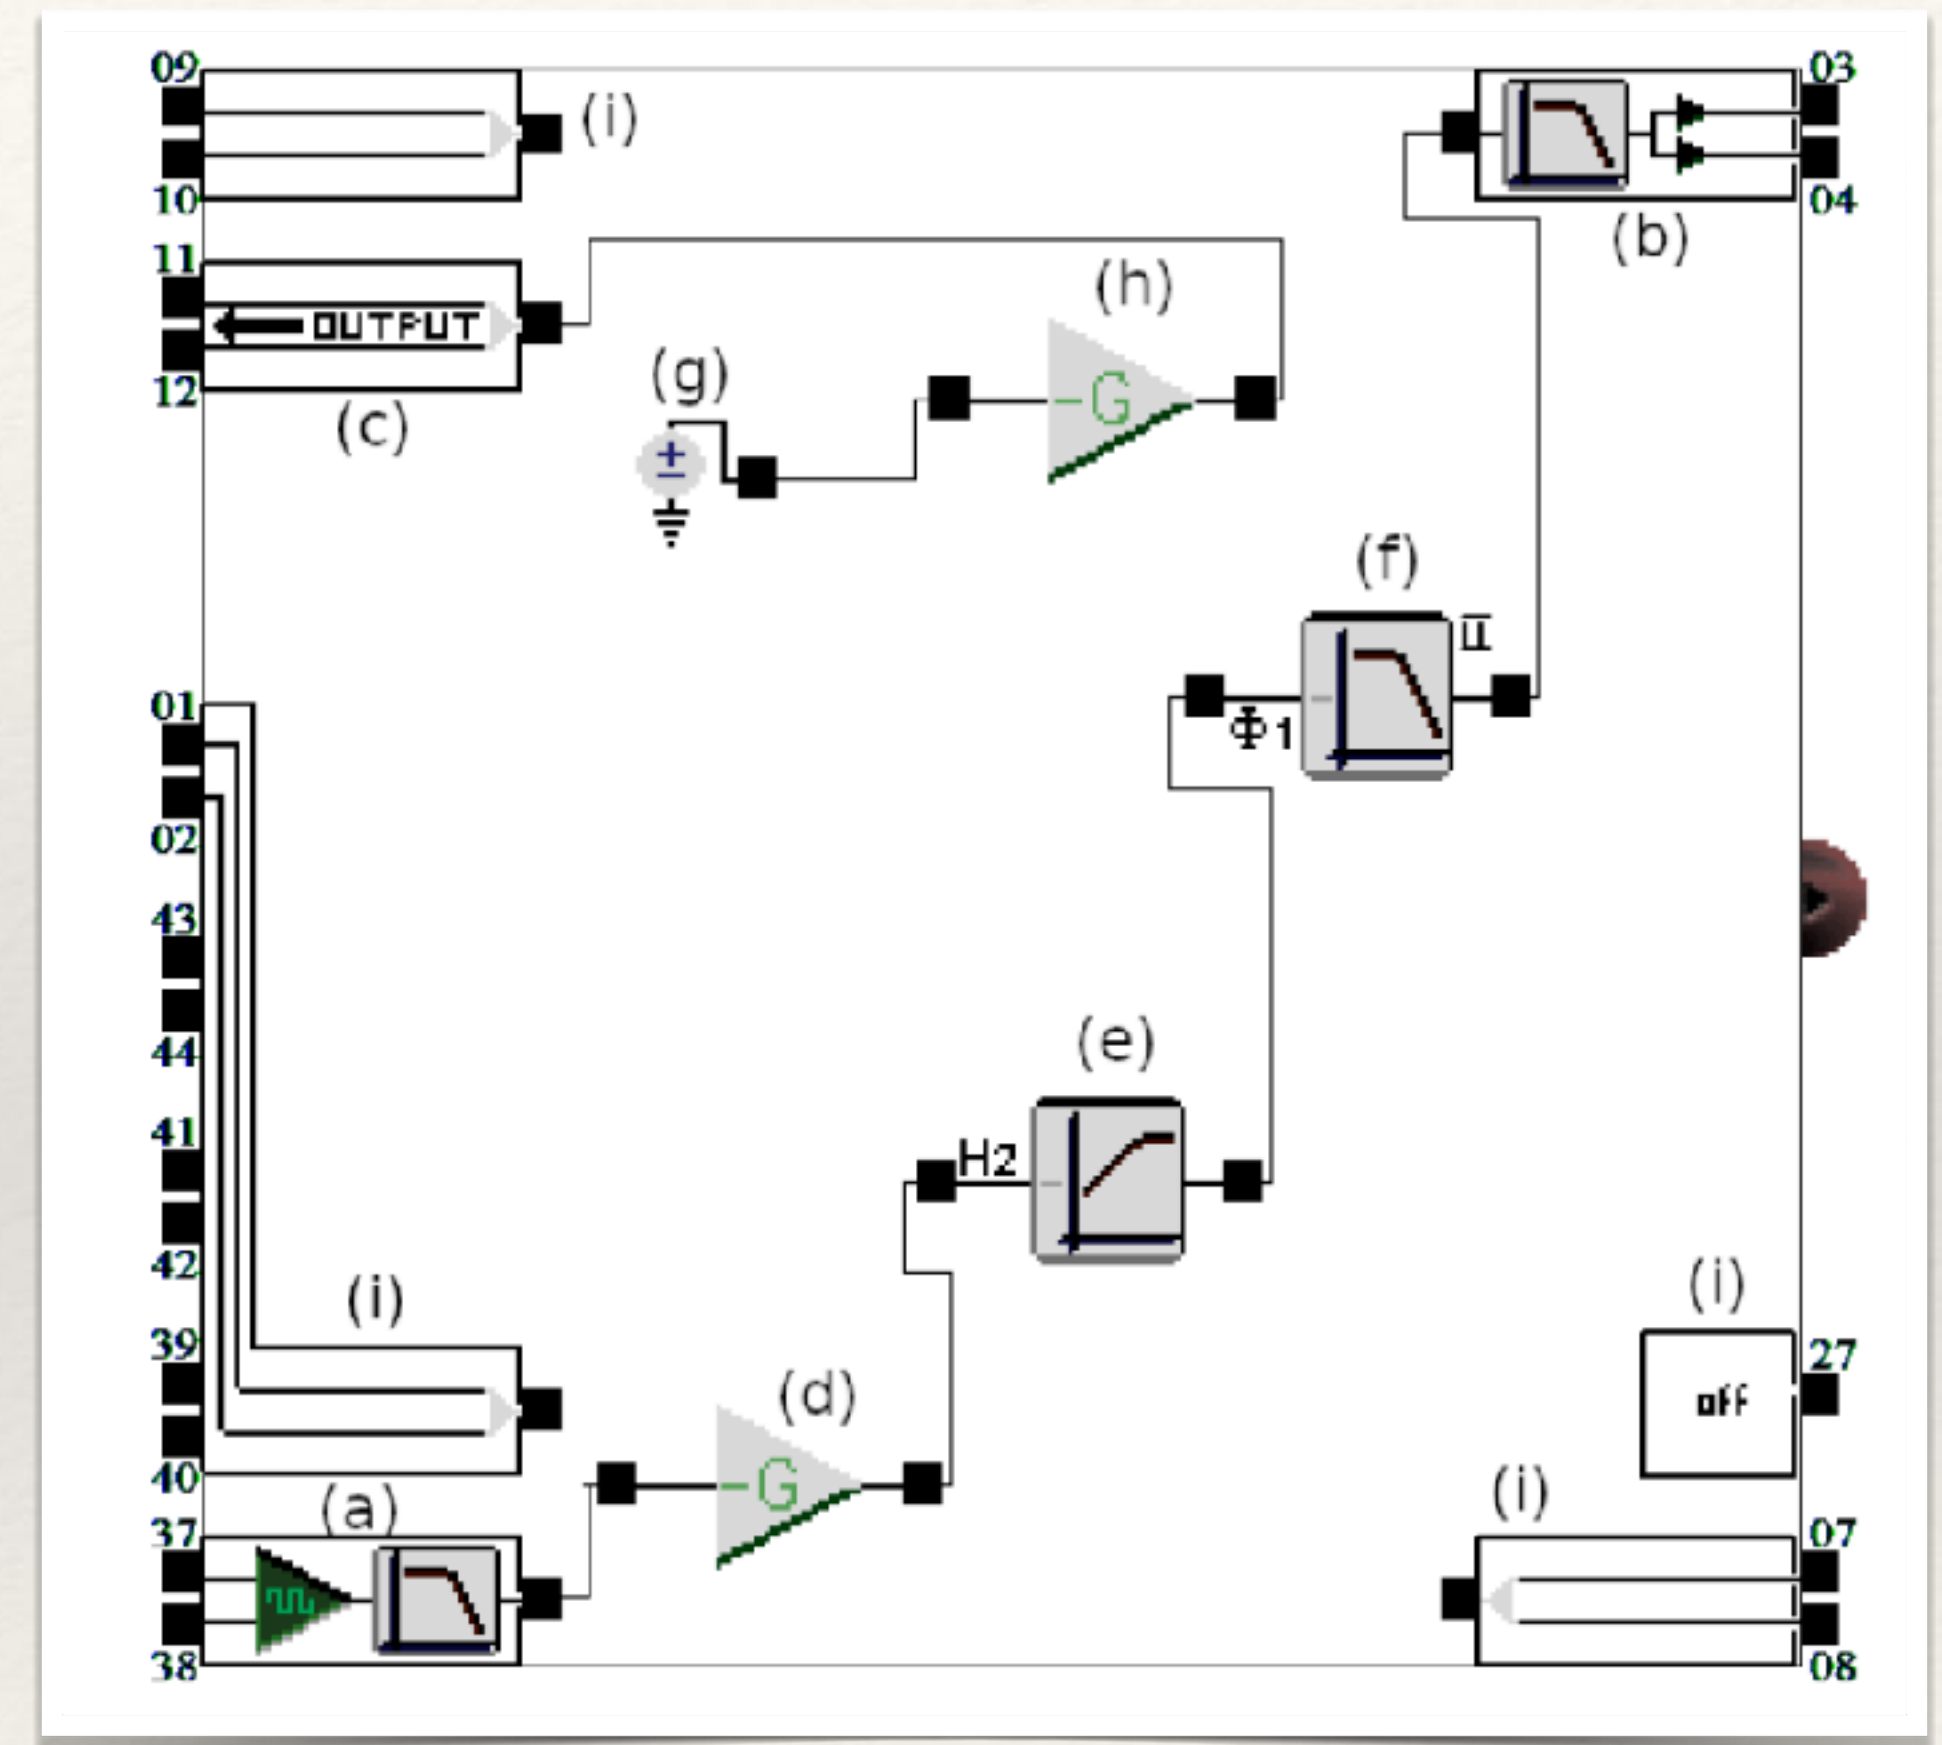

- The graph shows the projected and measured frequency responses of the pass-band filter.
- Upper and lower limits considering the measurement uncertainty of used device.
- The average error was 0.027 dB (SD = 0.163 dB) and the maximum error was 0.265 dB.

# Results: ECG Acquisition Circuit Test

- a) Inputs in differential mode connected to the two ECG electrodes and a Low pass filter to eliminate radio interference (gain = 128).
- b) Low-pass filter.
- c) Output in connected to third ECG electrode working as a reference.
- d) Inverter amplifier to increase the gain of input signal (gain=4).

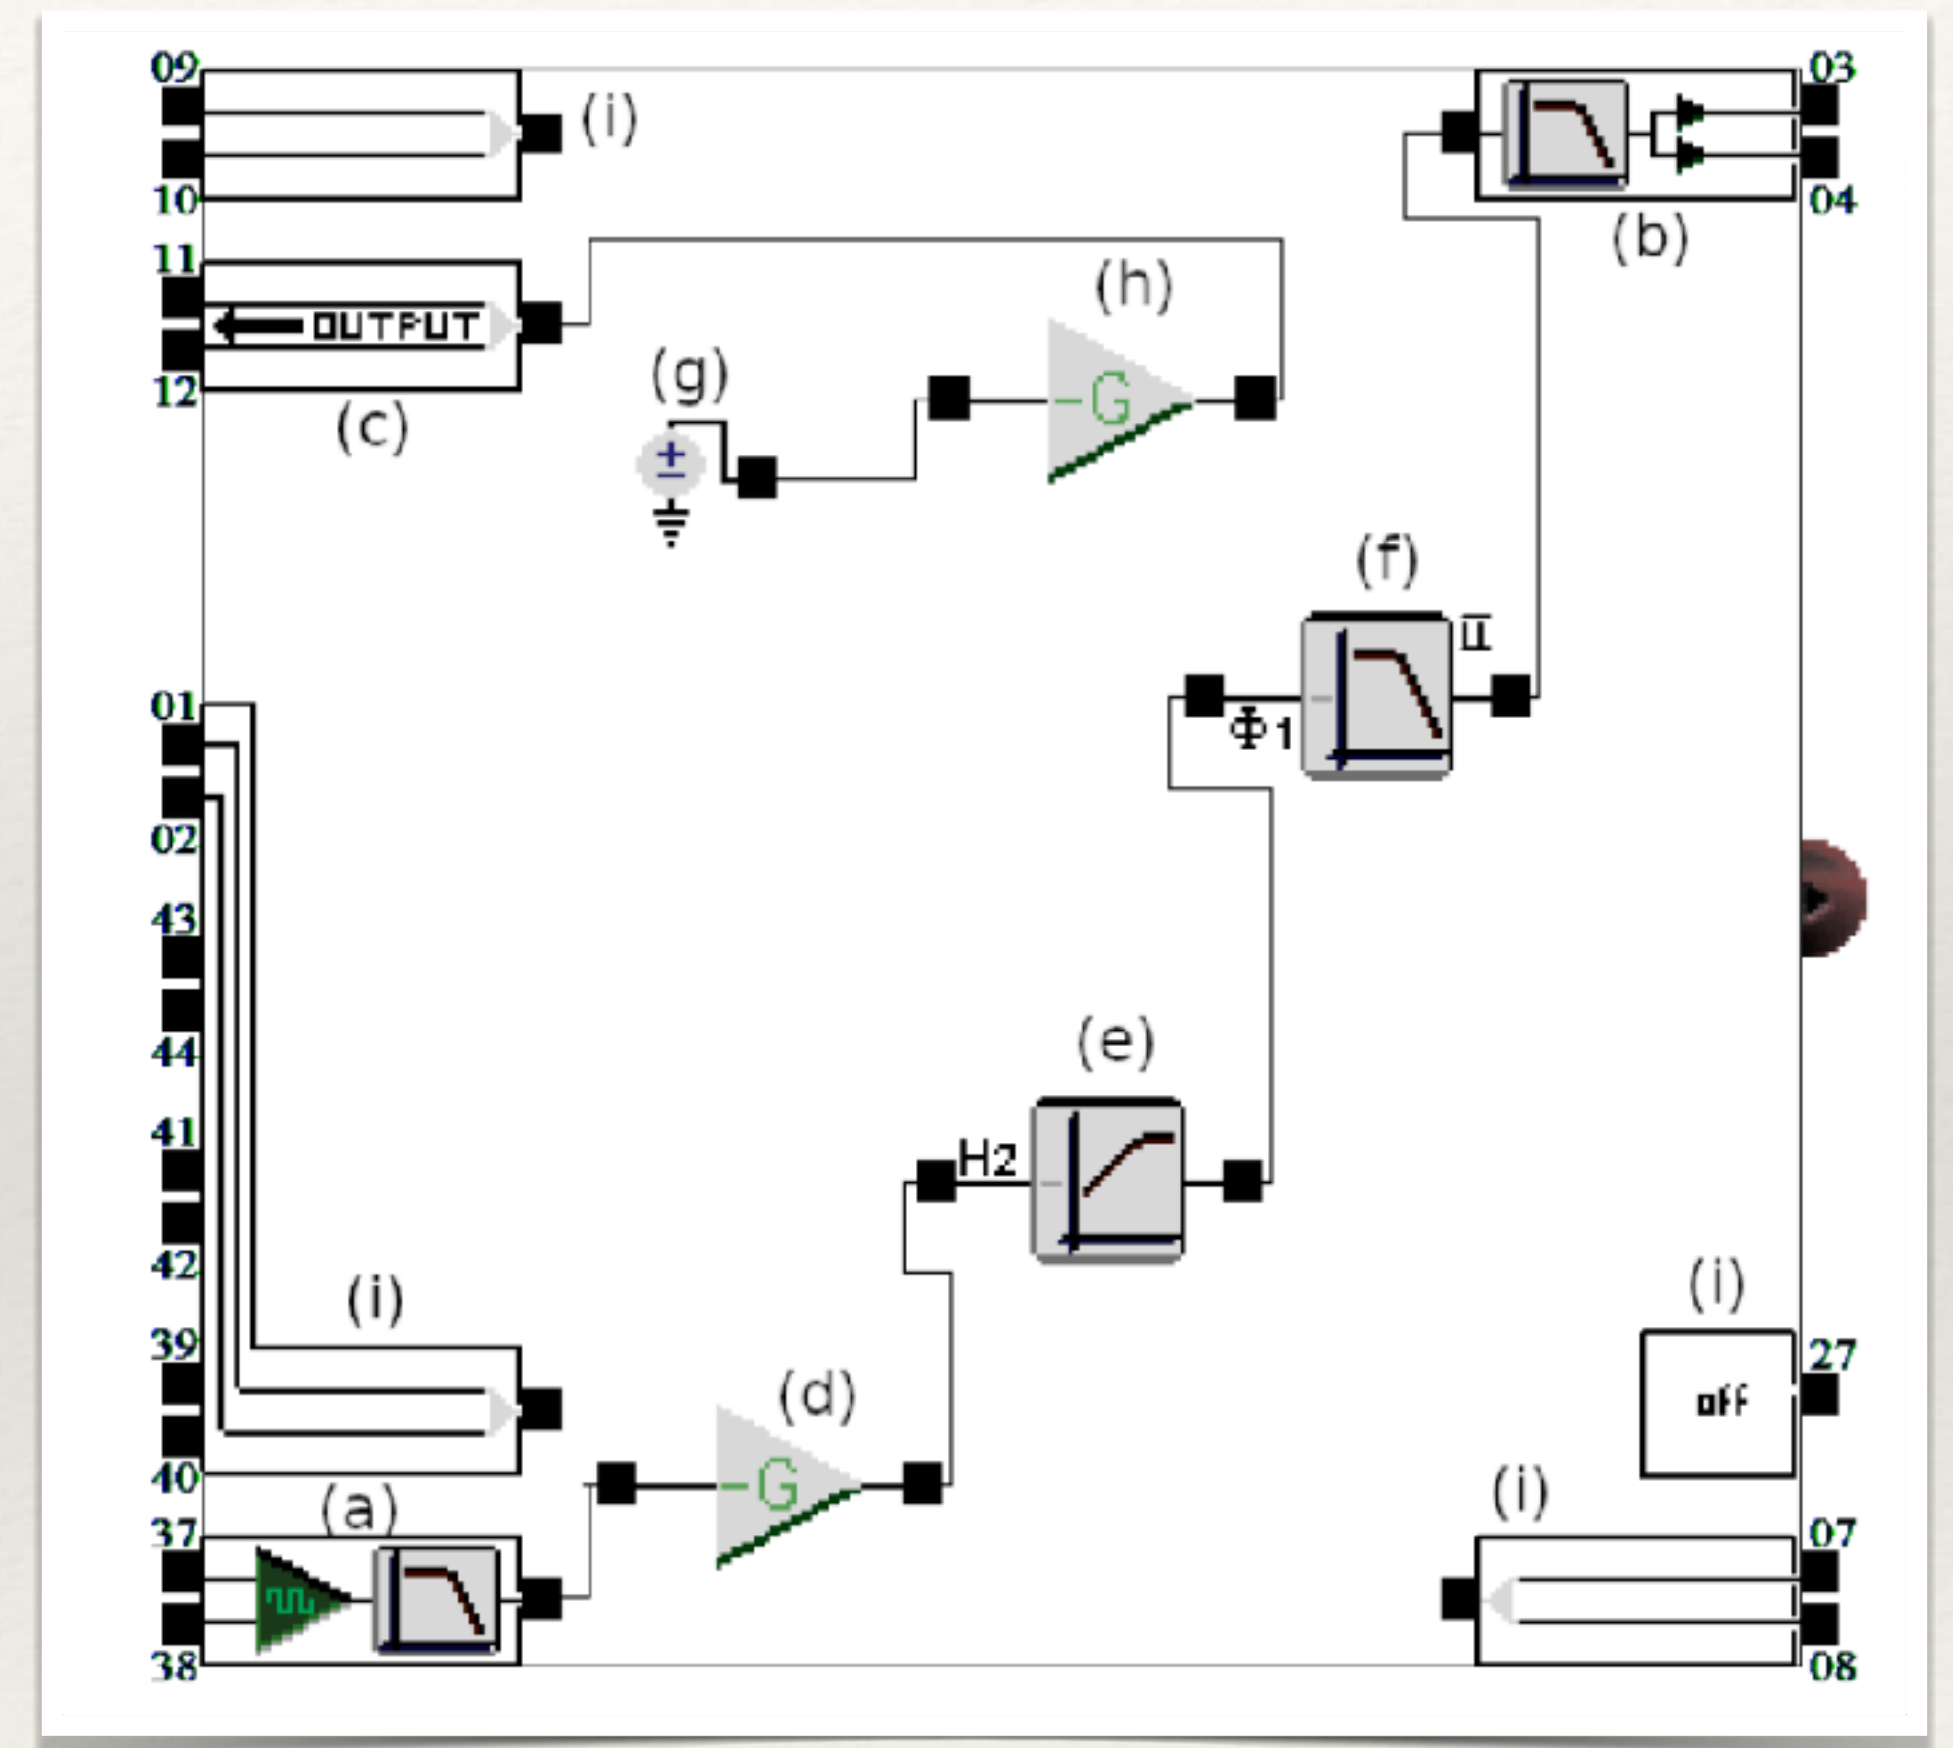

Circuit's block diagram for ECG signal acquisition. The blocks marked with (i) appear by default and are not used. The ACLK utilized was 125 kHz

# Results: ECG Acquisition Circuit Test

- e) Bilinear high-pass filter ( $F_c=0.504$  Hz) to eliminate the DC and low frequency components from the signal.
- f) Biquadrático low-pass filter ( $F_c=40$  Hz, gain=6) to act as an anti-aliasing filter.
- g) Voltage source +3V.
- h) Inverter amplifier (gain=0.01) to transform the voltage approximately 0V.

Circuit's block diagram for ECG signal acquisition. The blocks marked with (i) appear by default and are not used. The ACLK utilized was 125 kHz

# Results: ECG Acquisition Circuit Test

- Application image showing the ECG signal on computer.

```
#include "FPAA.h"
#include "TimerOne.h"

void setup(){
  Serial.begin(57600);
  while (!Serial);
  if(FPAA.begin("ECG3.ahf")) Serial.println("FPAA_configuration_OK");
  else Serial.println("FPAA_configuration_Error");
  FPAA.setClock(F125K);
  Timer1.initialize(1000); // Ts=1ms -> Fs=1000 samples/s
  Timer1.attachInterrupt(Timer1_ISR);
}

void Timer1_ISR(){
  int ECG_sample = analogRead(A0);
  Serial.println(ECG_sample>>2);
}

void loop(){
  while(1);
}
```

---

# Conclusions

---

- The Arduino Shield with FPAA allows implementation of most different analog circuits with a drag and drop desktop application.
- The flexibility makes possible the implementation of filters, linearizzers, rectifiers and other electronic circuits.
- The errors obtained in the tests were small and may be attributed due to the measurement uncertainties of the meters devices.
- The ECG signal acquisition circuit showed promising results, signal recorded with little noise, since was used unshielded 1.3m cables to connect to the electrodes.
- For future works the goal is to develop acquiring different bioelectrical signals such as EMG and EEG, for example, also a website to disseminate information and details about the shield.
- This work contributed to the biomedical engineering area and embedded system area. We didn't find any similar work.
